

BPL will be devastating, took the power company 2 years to correct a power line noise problem that was interfering with TV and amateur radio bands in my neighborhood.

Being that it will be regulated under part 15 rules, if interference is created to a licensed amateur service or any other radio service will the FCC order them to correct the problem or shut it down ? How many complaints will the FCC be able to handle from licensed services ?

The ARRL video shows it all and how it will effect amateur radio bands and most other licensed services. Japan has not allowed BPL due to the interference. Have the power companies actually showed any test results by a neutral firm that have taken tests to determine that it does not cause interference ? Only have seen word of mouth by the power company officials. Please consider rejecting BPL.
